▶ To be seen on a representation:

- repetition of patterns
- missing patterns
- repartition of different possible patterns
- comparison of different sequences

### Introduction

A DNA sequence is an infinite word

$$U = u_1 u_2 \ldots u_n \ldots \qquad \forall i, u_i \in \{A, C, G, T\}.$$

To be seen on a representation:

- repetition of patterns
- missing patterns
- repartition of different possible patterns
- comparison of different sequences
- Can we identify some characteristics
  - easy to study on the representation
  - different from a species to another species?

## Tree representation

$$U = u_1 u_2 \ldots u_n \ldots$$

Prefixes	Rev.prefixes	Suffixes
<i>u</i> <sub>1</sub>	<i>u</i> <sub>1</sub>	$u_1u_2u_3u_4\ldots$
$u_1 u_2$	$u_2 u_1$	$u_2 u_3 u_4 \dots$
$u_1 u_2 u_3$	$u_3 u_2 u_1$	<i>U</i> <sub>3</sub> <i>U</i> <sub>4</sub>

$$S_1 = U = 1001011001110\dots$$

$$S_1 = U = 1001011001110...$$
  
 $S_2 = 001011001110...$ 

$$S_1 = U = 1001011001110...$$
  
 $S_2 = 001011001110...$   
 $S_3 = 01011001110...$ 

$$\begin{split} S_1 &= U = 1001011001110 \dots \\ S_2 &= 001011001110 \dots \\ S_3 &= 01011001110 \dots \\ S_4 &= 1011001110 \dots \end{split}$$

$$\begin{split} S_1 &= U = 1001011001110\ldots \\ S_2 &= 001011001110\ldots \\ S_3 &= 01011001110\ldots \\ S_4 &= 1011001110\ldots \\ S_5 &= 011001110\ldots \end{split}$$

•

$$\begin{array}{l} S_1 = U = 1001011001110 \dots \\ S_2 = 001011001110 \dots \\ S_3 = 01011001110 \dots \\ S_4 = 1011001110 \dots \\ S_5 = 011001110 \dots \\ S_6 = 11001110 \dots \end{array}$$

$$\begin{split} S_1 &= U = 1001011001110\ldots \\ S_2 &= 001011001110\ldots \\ S_3 &= 01011001110\ldots \\ S_4 &= 1011001110\ldots \\ S_5 &= 011001110\ldots \\ S_6 &= 11001110\ldots \\ S_7 &= 1001110\ldots \end{split}$$

$$\begin{split} S_1 &= U = 1001011001110\ldots \\ S_2 &= 001011001110\ldots \\ S_3 &= 01011001110\ldots \\ S_4 &= 1011001110\ldots \\ S_5 &= 011001110\ldots \\ S_6 &= 11001110\ldots \\ S_7 &= 1001110\ldots \end{split}$$

The shape of the tree is closely related to the repetitions of patterns

Comes from the production of the letters:  $\{0, 1\}$  or  $\{A, C, G, T\}$ or from any finite alphabet. For a given word  $U = u_1 u_2 \dots u_n \dots$ ,

the tree process  $(\mathcal{T}_n)_{n\geq 0}$  is nonrandom.

### Where randomness is?

Comes from the production of the letters:  $\{0,1\}$  or  $\{A, C, G, T\}$  or an alphabet. For a given word  $U = u_1 u_2 \dots u_n \dots$ ,

the tree process  $(\mathcal{T}_n)_{n\geq 0}$  is nonrandom.

Different kinds of sources:

- Memoryless: Bernoulli or asymmetric i.i.d.
- Markov
- Probabilistic dynamical source on an alphabet A:
  - ▶ a partition of [0, 1] with open intervals  $\mathcal{I}_{\alpha}, \alpha \in \mathcal{A}$ ,
  - ▶ an encoding mapping  $\sigma : [0,1] \rightarrow \mathcal{A}$ , s.t.  $\sigma_{|\mathcal{I}_{\alpha}} \equiv \alpha$

- a transformation T,
- an initial density f.

Probabilistic dynamical source on an alphabet  $\mathcal{A}$ :

- ▶ a partition of [0,1] with open intervals  $\mathcal{I}_{\alpha}, \alpha \in \mathcal{A}$ ,
- ▶ an encoding mapping  $\sigma : [0,1] \rightarrow \mathcal{A}$ , s.t.  $\sigma_{|\mathcal{I}_{\alpha}} \equiv \alpha$
- a transformation T,
- an initial density f.
  - $x_1$  is chosen on [0, 1] with the density f
  - its orbit is  $x_1, T(x_1), T^2(x_1), ...$
  - then  $U = \sigma(x_1)\sigma(T(x_1))\sigma(T^2(x_1))\cdots = u_1u_2\ldots$

The inserted words (suffixes or reversed prefixes) are NOT independent.

•  $\ell_n$  = length shortest branch of the tree = fill-up level  $\mathcal{L}_n$  = length of the longest branch of the tree.  $D_n$  = insertion depth

### Results

 $\ell_n$  = length shortest branch of the tree = fill-up level  $\mathcal{L}_n$  = length of the longest branch of the tree.  $D_n$  = insertion depth

### Theorem

(Cénac et al. (07)) <u>For the DST</u> for a memoryless source or a Markovian source

$$\frac{\ell_n}{\ln n} \xrightarrow[n \to \infty]{\text{a.s.}} \frac{1}{h_+}, \quad \text{and} \quad \frac{\mathcal{L}_n}{\ln n} \xrightarrow[n \to \infty]{\text{a.s.}} \frac{1}{h_-}$$

### Results

 $\ell_n$  = length shortest branch of the tree = fill-up level  $\mathcal{L}_n$  = length of the longest branch of the tree.  $D_n$  = insertion depth

### Theorem

For the DST for a memoryless source or a Markovian source

$$\frac{\ell_n}{\ln n} \xrightarrow[n \to \infty]{\text{a.s.}} \frac{1}{h_+}, \quad \text{and} \quad \frac{\mathcal{L}_n}{\ln n} \xrightarrow[n \to \infty]{\text{a.s.}} \frac{1}{h_-}.$$
$$\frac{D_n}{\ln n} \xrightarrow[n \to \infty]{\text{P}} \frac{1}{h}$$

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

### Results

 $\ell_n$  = length shortest branch of the tree = fill-up level  $\mathcal{L}_n$  = length of the longest branch of the tree.  $D_n$  = insertion depth

### Theorem

For the DST for a memoryless source or a Markovian source

$$\frac{\ell_n}{\ln n} \xrightarrow[n \to \infty]{\text{a.s.}} \frac{1}{h_+}, \quad \text{and} \quad \frac{\mathcal{L}_n}{\ln n} \xrightarrow[n \to \infty]{\text{a.s.}} \frac{1}{h_-}$$

$$\frac{D_n}{\ln n} \xrightarrow[n \to \infty]{P} \frac{1}{h}$$

<u>For the suffix trie</u> for a dynamical source with a  $\phi$ -mixing condition

$$\frac{\ell_n}{|n \ n} \xrightarrow[n \to \infty]{\text{a.s.}} \frac{1}{h_+}.$$

s = s₁s₂...s<sub>n</sub>... denotes an infinite deterministic sequence.
 s<sup>(n)</sup> = s₁s₂...s<sub>n</sub>

 $X_n(s) \stackrel{\text{def}}{=}$  length of the branch corresponding to s in the tree  $\mathcal{T}_n$ 

$$\ell_n = \min_s X_n(s)$$
 and  $\mathcal{L}_n = \max_s X_n(s)$ .

- s = s₁s₂...s<sub>n</sub>... denotes an infinite deterministic sequence.
   s<sup>(n)</sup> = s₁s₂...s<sub>n</sub>
- T<sub>k</sub>(s) <sup>def</sup> size of the first tree where is inserted s<sup>(k)</sup>, X<sub>n</sub>(s) <sup>def</sup> length of the branch corresponding to s in T<sub>n</sub>.

$$\ell_n = \min_s X_n(s)$$
 and  $\mathcal{L}_n = \max_s X_n(s)$ .

X<sub>n</sub> and T<sub>k</sub> are in duality

 $\{X_n(s)\geq k\}=\{T_k(s)\leq n\}.$ 

$$P(\ell_n \le k-1) \le \sum_{s^{(k)}} P(T_k(s) > n) = \sum_{s^{(k)}} P(t^0_{s^{(k)}} + t^1_{s^{(k)}} > n)$$

•  $T_k(s) \stackrel{\text{def}}{=}$  size of the first tree where is inserted  $s^{(k)}$ ,

$$\ell_n = \min_s X_n(s)$$

$$P(\ell_n \le k-1) \le \sum_{s^{(k)}} P(T_k(s) > n) = \sum_{s^{(k)}} P(t^0_{s^{(k)}} + t^1_{s^{(k)}} > n)$$

where (for the suffix trie)

 $t_m^0 =$  hitting time of pattern m $t_m^1 =$  return time of pattern m.

sufficient:

$$\sum_{s^{(k)}} P(t^0_{s^{(k)}} > n/2) \text{ is the g.t. of a conv. series}$$
$$\sum_{s^{(k)}} P(t^1_{s^{(k)}} > n/2) \text{ is the g.t. of a conv. series}$$

$$t_m^0$$
 = hitting time of pattern *m*  
 $t_m^1$  = return time of pattern *m*.

It is sufficient to prove

 $\sum_{s^{(k)}} P(t^0_{s^{(k)}} > n/2)$  is the g.t. of a conv. series

 $\sum_{s^{(k)}} P(t^1_{s^{(k)}} > n/2)$  is the g.t. of a conv. series

 $t_m^0$  = hitting time of pattern m $t_m^1$  = return time of pattern m. To prove:

$$\sum_{s^{(k)}} P(t^0_{s^{(k)}} > n/2)$$
 is the g.t. of a conv. series

$$\sum_{s^{(k)}} P(t^1_{s^{(k)}} > n/2)$$
 is the g.t. of a conv. series

 $\uparrow$  for a pattern *m* 

$$|P(t_m^1 > t) - Ce^{-\xi_m t}| \leq C' t^eta$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

The more auto-correlated a word is, the more easily it may reappear and the smaller its return time is.

Methods - 2 - Less easy

### The more auto-correlated a word is, the more easily it may reappear and the smaller its return time is.

### To achieve this

Meaning of such mixing conditions: When two parts of a word

$$w = \ldots w_0 | w_1 w_2 \ldots w_n | w_{n+1} \ldots$$

are far (more than n letters) from each other, then, these two parts are "almost" independent.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

# The mixing assumptions

Assumptions on the geometry of the branches of the dynamical system (T, f):

- branches of class  $C^2$
- bounded distorsion of the branches

weak  $\phi$ -mixing condition (*Paccaut (99)*):  $\mu$  stationary measure,  $\exists C, \exists \xi \in ]0, 1[$  s.t.  $\forall P, Q$  borelians in [0, 1],

$$|\mu(P\cap T^{-n}Q)-\mu(P)\mu(Q)|\leq C\xi^n\mu(Q)$$

### ,

$$\begin{split} \phi-\text{mixing condition } & (\textit{Galves-Schmidt (97)}):\\ \exists \phi \text{ decreasing, positive, tending to 0 s.t.}\\ & \sup_{P \in \mathcal{F}_n, Q} \frac{\mu(P \cap T^{-(n+l)}Q) - \mu(P)\mu(Q)}{\mu(P)\mu(Q)} \leq \phi(l) \end{split}$$

$$|P(t_m^1 > t) - Ce^{-\xi_m t}| \le C' t^\beta$$
