1.1 - Introduction

The concepts of type and cotype of Banach spaces were introduced mainly by J. Hoffmann-Jørgensen and by B. Maurey in the study of Banach spaces-valued random variables.

Since then the theory of type and cotype have found several applications and became a central part of the geometry of Banach spaces, and of the linear and multilinear operator theory and operator ideals.

1.1 - Introduction

The concepts of type and cotype of Banach spaces were introduced mainly by J. Hoffmann-Jørgensen and by B. Maurey in the study of Banach spaces-valued random variables.

Since then the theory of type and cotype have found several applications and became a central part of the geometry of Banach spaces, and of the linear and multilinear operator theory and operator ideals.

Our main goals throughout this recent research has been to define and study these concepts in a multilinear scenario setting up the relationships of new definitions with the linear and multilinear theory already established.

We introduce the class of multilinear operators of type (p_1, \ldots, p_n) and polynomials of type p and show some relationships between the first one with the multi-ideals constructed by composition and linearization methods from the class of linear operator of type p.

2.1 - Linear operators of type p

Let the sequence $(r_j)_{j=1}^{\infty}$ of the Rademacher functions. We say that a sequence $(x_j)_{j=1}^{\infty}$ in *E* is *almost unconditionally summable* if the series $\sum_j r_j(t)x_j$ converges in $L_2([0, 1]; E)$.

The set of these sequences, denoted Rad(E), is a Banach space equipped with the norm

$$||(x_i)_{i=1}^{\infty}||_{\mathrm{Rad}(E)} = \left\|\sum_{j=1}^{\infty} r_j x_j\right\|_{L_2(E)} = \left(\int_0^1 \left\|\sum_{j=1}^{\infty} r_j(t) x_j\right\|^2 dt\right)^{1/2}$$

3.1 - Some definitions and notation required

We notice that

- $(\tau_p, || \cdot ||_{\tau_p})$ is a Banach Ideal of linear operators; (this is well known)
- $\left(\tau^n_{(\rho_1,\ldots,\rho_n)}, ||\cdot||_{\tau^n_{(\rho_1,\ldots,\rho_n)}}\right)$ is a Banach multi-ideal (we proved this in our work).

We will consider two methods to build multi-ideals from ideals of linear operators. Given $\mathcal{I}_1, ..., \mathcal{I}_n$ ideals of linear operators:

1) An *n*-linear mapping $T \in \mathcal{L}(E_1, ..., E_n; F)$ is said to be of type $[\mathcal{I}_1, ..., \mathcal{I}_n]$, in symbols $T \in [\mathcal{I}_1, ..., \mathcal{I}_n](E_1, ..., E_n; F)$, if $l_j(T) \in \mathcal{I}_j(E_j; \mathcal{L}(E_1, \underline{\mathbb{N}}, E_n; F))$, for all $j \in \{1, ..., n\}$, where the operator $l_j : \mathcal{L}(E_1, ..., E_n; F) \to \mathcal{L}(E_j; \mathcal{L}(E_1, \underline{\mathbb{N}}, E_n; F))$ is defined by

$$I_j(T)(x_j)(x_1, \stackrel{[1]}{\ldots}, x_n) = T(x_1, ..., x_n),$$

and $\overset{[l]}{\ldots}$ means that the *j*-th coordinate is not involved.

If $\mathcal{I}_1, ..., \mathcal{I}_n$ are normed ideals, we define

 $||T||_{[\mathcal{I}_1,...,\mathcal{I}_n]} = \max \{||I_1(T)||_{\mathcal{I}_1} \cdots ||I_n(T)||_{\mathcal{I}_n}\},\$

for $T \in [I_1, ..., I_n] (E_1, ..., E_n; F)$.

1) An *n*-linear mapping $T \in \mathcal{L}(E_1, ..., E_n; F)$ is said to be of type $[\mathcal{I}_1, ..., \mathcal{I}_n]$, in symbols $T \in [\mathcal{I}_1, ..., \mathcal{I}_n](E_1, ..., E_n; F)$, if $I_j(T) \in \mathcal{I}_j(E_j; \mathcal{L}(E_1, [!], E_n; F))$, for all $j \in \{1, ..., n\}$, where the operator $I_j : \mathcal{L}(E_1, ..., E_n; F) \to \mathcal{L}(E_j; \mathcal{L}(E_1, [!], E_n; F))$ is defined by

$$I_j(T)(x_j)(x_1, \overset{[j]}{\ldots}, x_n) = T(x_1, ..., x_n),$$

and ^[j] means that the *j*-th coordinate is not involved.

If $\mathcal{I}_1,...,\mathcal{I}_n$ are normed ideals, we define

$$||T||_{[\mathcal{I}_1,...,\mathcal{I}_n]} = \max \{||I_1(T)||_{\mathcal{I}_1} \cdots ||I_n(T)||_{\mathcal{I}_n}\},\$$

for $T \in [I_1, ..., I_n] (E_1, ..., E_n; F)$.

2) Let \mathcal{I} be an ideal of linear operators. A mapping $T \in \mathcal{L}(E_1, ..., E_n; F)$ belongs to $\mathcal{I} \circ \mathcal{L}$, denoted by $T \in \mathcal{I} \circ \mathcal{L}(E_1, ..., E_n; F)$, if there are a Banach space *G*, an operator $u \in \mathcal{I}(G; F)$ and an *n*-linear mapping $B \in \mathcal{L}(E_1, ..., E_n; F)$ such that $T = u \circ B$.

If \mathcal{I} is a normed ideal, for $T \in \mathcal{I} \circ \mathcal{L} (E_1, ..., E_n; F)$, we define

 $||T||_{\mathcal{I} \circ \mathcal{L}} = \inf \{ ||B|| ||u||_{\mathcal{I}} : T = u \circ B, \text{ with } u \text{ and } B \text{ as above} \}.$

It is well-known that if \mathcal{I} and $\mathcal{I}_1, ..., \mathcal{I}_n$ are normed ideals then $([\mathcal{I}_1, ..., \mathcal{I}_n], || \cdot ||_{[\mathcal{I}_1, ..., \mathcal{I}_n]})$ and $(\mathcal{I} \circ \mathcal{L}, || \cdot ||_{\mathcal{I} \circ \mathcal{L}})$ are normed ideals of multilinear mappings.

The procedures with which the above ideals were created are called linearization and composition methods, respectively.

3.1 - Relationship with the ideals $\tau_p \circ \mathcal{L}$ and $[\tau_{q_1}, ..., \tau_{q_n}]$

So, we prove that

Theorem

If $1 and <math>\frac{1}{p} = \frac{1}{p_1} + \dots + \frac{1}{p_n}$ then $\tau_p \circ \mathcal{L} \subseteq \tau^n_{(p_1,\dots,p_n)}$, for all $n \in \mathbb{N}$ and

$$||T||_{\tau^n_{(p_1,\ldots,p_n)}} \leq ||T||_{\tau_p \circ \mathcal{L}}.$$

and, for instance, that

Theorem

If $1 < q_1, ..., q_n \le 2$ and $\frac{1}{2} \le \frac{1}{p_1} + \dots + \frac{1}{p_n} < 1$ then

$$\tau_{(p_1,\ldots,p_n)}^n \nsubseteq [\tau_{q_1},\ldots,\tau_{q_n}],$$

for all $n \in \mathbb{N}$.
