## Planarity Method

John M. Boyer<br>(PureEdge Solutions Inc.)<br>Cristina G. Fernandes<br>Alexandre Noma<br>José Coelho de Pina<br>(Universidade de São Paulo)

## Planar Graphs

A graph is planar if it can be embedded into the plane without edge crossings.

planar graph

planar embedding

## Planar Graphs

A graph is planar if it can be embedded into the plane without edge crossings.

nonplanar graphs
Kuratowski subgraphs

## Planarity Test

Problem: Given a graph, decide whether it is planar or not.

## Planarity Test

## Key Simple Problem

$G$ graph on vertex set $V_{T} \cup\{x, y\}$
$T$ : $V_{T}$ induces a tree $T$
$x y$ is an edge

## Key Simple Problem

$G$ graph on vertex set $V_{T} \cup\{x, y\}$
$T$ : $V_{T}$ induces a tree $T$
$x y$ is an edge
$X$ neighbors of $x$ in $T$

## Key Simple Problem

$G$ graph on vertex set $V_{T} \cup\{x, y\}$
$T$ : $V_{T}$ induces a tree $T$
$x y$ is an edge
$X$ neighbors of $x$ in $T$
$Y$ neighbors of $y$ in $T$

$$
X Y=X \cap Y
$$

## Key Simple Problem

Give an algorithm that receives $T, x y, X, Y$ and decides whether there is an embedding of $T+x$ leaving all $Y$ vertices on the 'frame'.

$\mathrm{YES} \Leftrightarrow G$ is planar

## Key Simple Problem

Give an algorithm that receives $T, x y, X, Y$ and decides whether there is an embedding of $T+x$ leaving all $Y$ vertices on the 'frame'.

$\mathrm{YES} \Leftrightarrow G$ is planar

## $X Y$-path

Want a path in $T$ connecting 2 vertices in $X$ and 'splitting' $X$ and $Y$.

## $X Y$-path

Want a path in $T$ connecting 2 vertices in $X$ and 'splitting' $X$ and $Y$.

## Reduction

Leaves not in $X \cup Y$ do not matter.

## Reduction

Leaves not in $X \cup Y$ do not matter.

## Reduction

Leaves not in $X \cup Y$ do not matter.

## Reduction

Leaves not in $X \cup Y$ do not matter.

## Reduction

Leaves not in $X \cup Y$ do not matter.

## Reduction

Leaves not in $X \cup Y$ do not matter.

## Reduction

Leaves in $Y \backslash X$ can be 'contracted'.

## Reduction

Leaves in $Y \backslash X$ can be 'contracted'.

## Reduction

Leaves in $Y \backslash X$ can be 'contracted'.

## Reduction

Leaves in $Y \backslash X$ can be 'contracted'.

## Reduction

Leaves in $Y \backslash X$ can be 'contracted'.

## Reduction

Leaves in $Y \backslash X$ can be 'contracted'.

## Reduction

Leaves in $Y \backslash X$ can be 'contracted'.

## Reduction

Leaves in $X \backslash Y$ can be 'contracted'.

## Reduction

Leaves in $X \backslash Y$ can be 'contracted'.

## Reduction

Leaves in $X \backslash Y$ can be 'contracted'.

## Reduction

Leaves in $X \backslash Y$ can be 'contracted'.

## Reduction

Leaves in $X \backslash Y$ can be 'contracted'. All leaves are in $X Y=X \cap Y$.

## Terminals

terminals := leaves of the reduced tree.

## At Most 2 Terminals

Answer YES Why?

$$
e_{x}^{y}
$$

terminal

## At Most 2 Terminals

Answer YES
$\leq 2$ terminals $\Rightarrow$ reduced tree is a path

$$
e^{y} x
$$

## At Most 2 Terminals

Answer YES
$\leq 2$ terminals $\Rightarrow$ path in $G$

## At Most 2 Terminals

Answer YES
$\leq 2$ terminals $\Rightarrow$ path in $G$ connecting vertices in $X$

## At Most 2 Terminals

Answer YES
$\leq 2$ terminals $\Rightarrow X Y$-path

## At Most 2 Terminals

Answer YES
$\leq 2$ terminals $\Rightarrow$ frame

## 3 Terminals

Answer is NO Why?

terminal
terminal

## 3 Terminals

Answer is NO
In $T$ we have:

## 3 Terminals

Answer is NO
$G$ nonplanar $\Rightarrow \mathrm{NO}$

## 3 Terminals

Answer is NO
$G$ nonplanar $\Rightarrow \mathrm{NO}$

## 3 Terminals

Answer is NO
$G$ nonplanar $\Rightarrow \mathrm{NO}$

## Algorithm

Each iteration begins with: $T, X, Y$
Each iteration consists of:
Case 1: All leaves of $T$ are in $X \cap Y$
terminals := leaves of $T$
Case 1A: $T$ has $\leq 2$ terminals
Return YES and stop
Case 1B: $T$ has 3 terminals
Return NO and stop $\triangleright G$ has $K_{3,3} \Rightarrow$ nonplanar
Case 2: $T$ has a leaf not in $X \cap Y$
$T^{\prime}, X^{\prime}, Y^{\prime} \leftarrow \operatorname{Reduce}(T, X, Y)$
Start anew with $T^{\prime}, X^{\prime}, Y^{\prime}$ in the role of $T, X, Y$

## Slightly More General Problem

$G$ graph on vertex set $V_{H} \cup\{x, y\}$
$H$ planar induced subgraph of $G$
$F$ frame of $H$
$x y$ is an edge

## Slightly More General Problem

$G$ graph on vertex set $V_{H} \cup\{x, y\}$
$H$ planar induced subgraph of $G$
$F$ frame of $H$
$x y$ is an edge
$X$ neighbors of $x$ in $F$

## Slightly More General Problem

$G$ graph on vertex set $V_{H} \cup\{x, y\}$
$H$ planar induced subgraph of $G$
$F$ frame of $H$
$x y$ is an edge
$X$ neighbors of $x$ in $F$
$Y$ neighbors of $y$ in $F$

$$
X Y=X \cap Y
$$

## Slightly More General Problem

Give an algorithm that receives $F, x y, X, Y$ and decides whether there is an embedding of $F+x$ leaving all $Y$ vertices on the new frame.

$\mathrm{YES} \Leftrightarrow G$ is planar

## Slightly More General Problem

$\mathrm{YES} \Leftrightarrow G$ is planar

## Block Tree

## Block Tree

P-node := vertex of $F$
C-node := block of $F$

## Apply Previous Algorithm

Apply the previous algorithm to the block tree $T$ of $F$

## Apply Previous Algorithm

$\mathrm{NO} \Rightarrow \mathrm{NO}$

## Apply Previous Algorithm

## YES $\Rightarrow$ PERHAPS

## Apply Previous Algorithm

## YES $\Rightarrow$ PERHAPS

$G$ nonplanar $\Rightarrow \mathrm{NO}$

## Apply Previous Algorithm

YES $\Rightarrow$ PERHAPS
$G$ nonplanar $\Rightarrow \mathrm{NO}$

## Apply Previous Algorithm

YES $\Rightarrow$ PERHAPS
$G$ planar $\Rightarrow$ YES

## Apply Previous Algorithm

YES $\Rightarrow$ PERHAPS
$G$ planar $\Rightarrow$ YES

## LEC-numbering

Property: For each $i, G[1 \ldots i-1]$ and $G[i \ldots n]$ are connected.

## LEC Method

Receives a biconnected graph $G$ and returns YES if $G$ is planar, and NO otherwise.

Number the vertices of $G$ according to an LEC-numbering
Each iteration begins with:

- $H$ planar induced subgraph of $G$
- $F$ frame of $H$

At beginning of the 1st iteration:

$$
H=\emptyset \quad F=\emptyset
$$

## LEC Method

Each iteration consists of:
Case 1: $H=G$
Return YES and stop
Case 2: $H \neq G$
$x \leftarrow$ smallest numbered vertex in $G-V_{H}$
$X \leftarrow$ neighbors of $x$ in $F$
$Y \leftarrow$ neighbors of $V_{G}-\left(V_{H}+x\right)$ in $F \quad \triangleright y$
Case 2A: There is no $X Y$-path in $F$ Return NO and stop
Case 2B: There is an $X Y$-path in $F$
$H^{\prime}, F^{\prime} \leftarrow \operatorname{CentraL}(F, X, Y)$
Start anew with $H^{\prime}$ and $F^{\prime}$ in the role of $H$ and $F$

# Shih and Hsu implementation 

LEC-numbering

block tree of frame
search for $X Y$-path $\Longleftrightarrow$ finding terminals fast
updating the frame $\Longleftrightarrow$ updating the PC-tree

## DFS-numbering

Number the vertices according to a postorder traversal of a DFS-tree of $G$.

Property: For each $i, G[i . . n]$ is connected.

## PC-tree

$b(v)$ - largest $i$ such that a descendant of $v$ in $T$ is a neighbor of $i$ in $G$.

## Terminals

$b(v)$ - largest $i$ such that a descendant of $v$ in $T$ is a neighbor of $i$ in $G$.

## Terminals

$b(v)$ - largest $i$ such that a descendant of $v$ in $T$ is a neighbor of $i$ in $G$.

## Terminals

## $x$ - current vertex

$T$ - current PC-tree

## Terminals

$x$ - current vertex
$T$ - current PC-tree
Node $t$ in $T$ is a terminal if

1. $b(t)>x$

## Terminals

$x$ - current vertex
$T$ - current PC-tree
Node $t$ in $T$ is a terminal if

1. $b(t)>x$
2. $t$ has a descendant in $T$ that is a neighbor of $x$ in $G$

## Terminals

$x$ - current vertex
$T$ - current PC-tree
Node $t$ in $T$ is a terminal if

1. $b(t)>x$
2. $t$ has a descendant in $T$ that is a neighbor of $x$ in $G$
3. no proper descendant of $t$ satisfies (1) and (2)

## Finding terminals

## Finding terminals

## Finding terminals

## Finding terminals

## Finding terminals

## C-node test

## C-node test

- $b(v)=x$
- $b(v)>x$ and...

## Updating the PC-tree

- creation of new C-node;
- updating some $b$ labels;
- unmarking marked vertices.

## Linear running-time

Each iteration takes time proporcional to the number of vertices traversed.

A traversed vertex either (corresponds to one that) "desappears", or enters for the first time in a C-node, or changes to a new C-node.

At most two traversed vertices per C-node move to another C-node, and the number of C -nodes is bounded by the number of edges.
