Performance Analysis of Business Processes

To improve efficiency in organizations we need

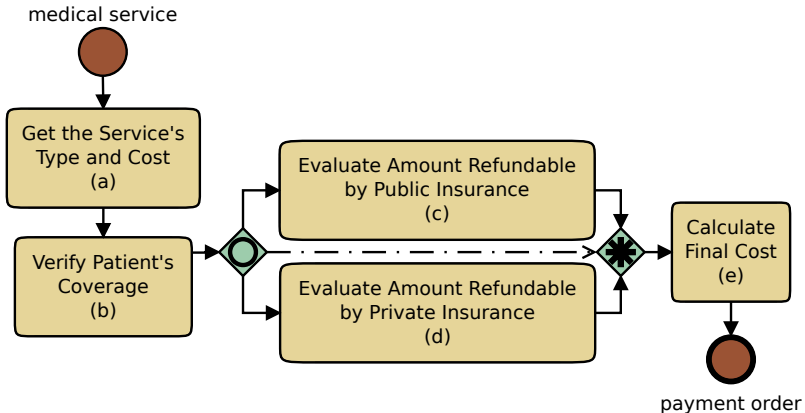

- ▶ To **understand how** the operational processes work
- ▶ To **optimize** their functioning

Main challenges

- ▶ Business processes generally are **large-scale** systems with **complex** structure
- ▶ **Difficulty to express quantitative** aspects using **business process modeling languages**
- ▶ Resource utilization – where and how the business process components are executed

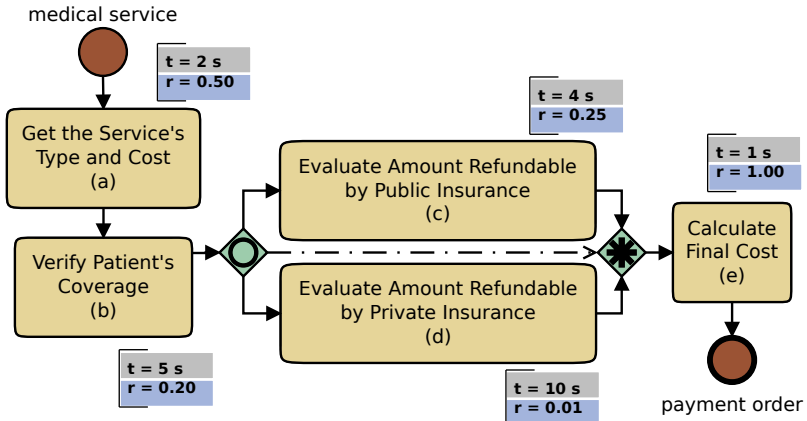

Cost of a Medical Service in the French Health-Care System

⇒ Service used by thousands of people concurrently

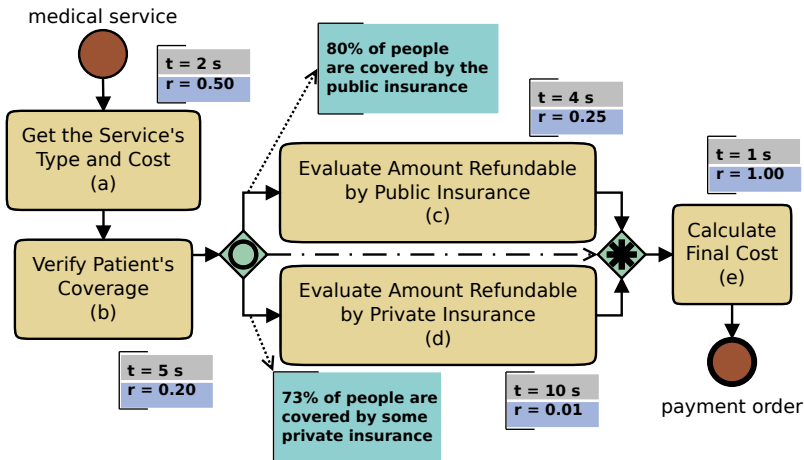

Cost of a Medical Service in the French Health-Care System

⇒ Service used by thousands of people concurrently

Cost of a Medical Service in the French Health-Care System

⇒ Service used by thousands of people concurrently

Performance Analysis Modeling Applied to Business Processes

Objective: compare quantitative modeling methods in the business process management domain

Methodology

- ▶ Selection of **3 modeling environments** to performance evaluation
- ▶ Definition of several **business process scenarios**
- ▶ **Mapping of the scenarios** to performance evaluation models
- ▶ **Numerical analysis** of the models
- ▶ **Comparison of the results** under different criteria

Outline of the Talk

Business Processes

- Context

- Example in BPMN (Business Process Model and Notation)

- Goal

Comparison of Formalisms

- Methodology

- Main Results

Split/Merge Example

- Business Process Model

- Mapping to a Performance Analysis Model

Synthesis

- Concluding Remarks

- Ongoing Work and Future Plans

Selected Techniques for Performance Evaluation

Stochastic formalisms

- ▶ Generalized Stochastic Petri Nets (**GSPN**)
[Marco Marsan, Gianni Conte, Gianfranco Balbo – 1984]
- ▶ Performance Evaluation Process Algebra (**PEPA**)
[Jane Hillston – 1996]
- ▶ Stochastic Automata Networks (**SAN**)
[Brigitte Plateau – 1985]

Software tools

- ▶ SMART (<http://www.cs.ucr.edu/~ciardo/SMART>)
- ▶ PEPA Plug-in (<http://www.dcs.ed.ac.uk/pepa/tools/plugin>)
- ▶ PEPS (<http://www-id.imag.fr/Logiciels/peps>)

Business Process Scenarios Characteristics

Basic structures

- ▶ Sequences, OR splits/joins, AND splits/joins and cycles

Complex branching and merging structures

- ▶ Examples: multi-choice, multi-merge, etc.

Features of performance modeling formalisms

- ▶ Examples: functional transitions, variable activity rates

Comparison Criteria

Modeling perspective

- ▶ Expressive power – **direct representation** of the scenarios
- ▶ Abstraction power – **level of generality** of the process models
- ▶ Facility to enlarge – **extensions without impacting** the previous modeled behavior
- ▶ Readability – view of the **business logic** from the model

Analysis perspective

- ▶ Computational resources (execution time and memory consumption)
- ▶ Supporting tool

Comparison Summary of the Formalisms

Under the modeling perspective

Modeling criteria	GSPN	PEPA	SAN
Expressive power	+	-	+
Abstraction power	+	+/-	+
Facility to enlarge	-	+	+/-
Readability	-	+	+

Split/Merge Example

Business Process Model

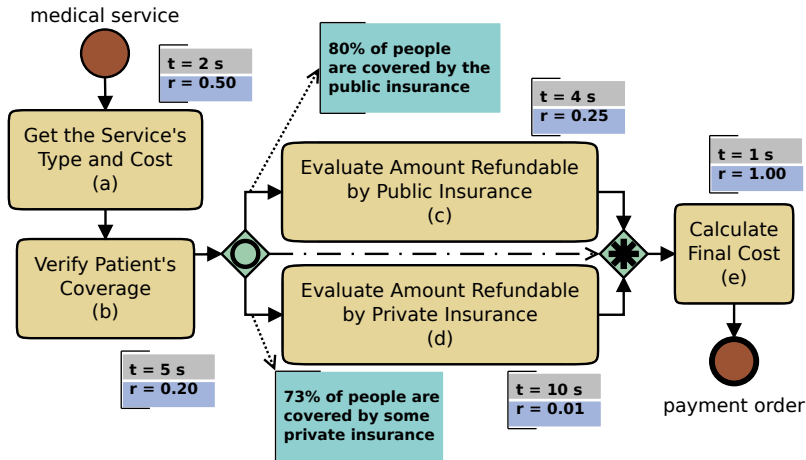

Mapping to a Performance Analysis Model

Synthesis

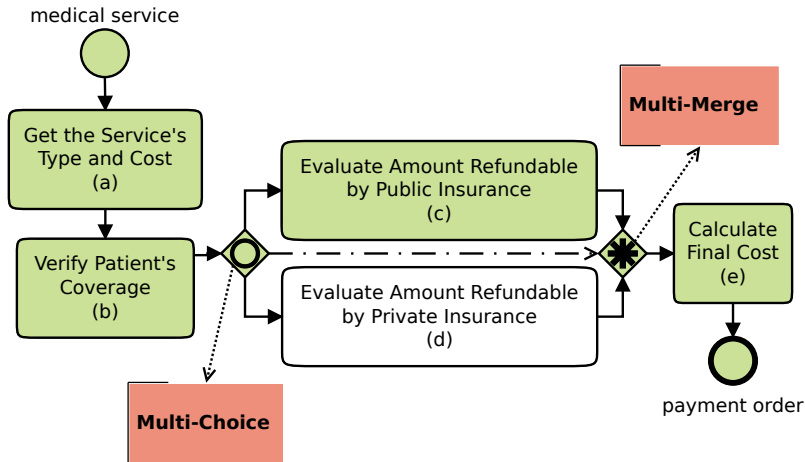

Concluding Remarks

Ongoing Work and Future Plans

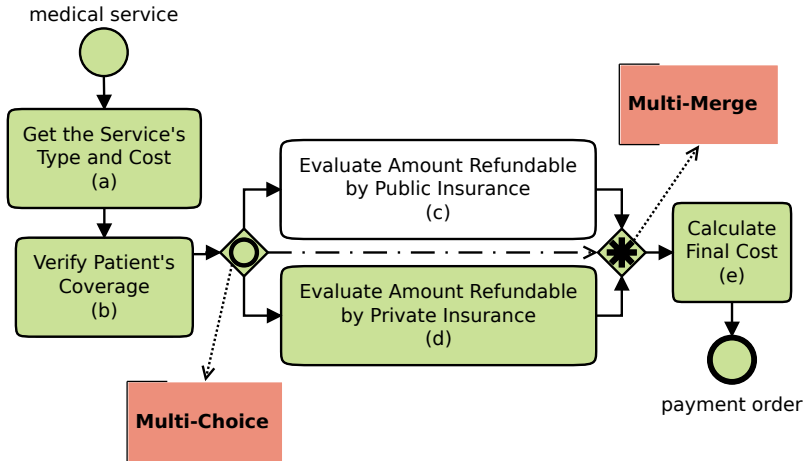

French Health-Care System (BPMN Annotated Model)

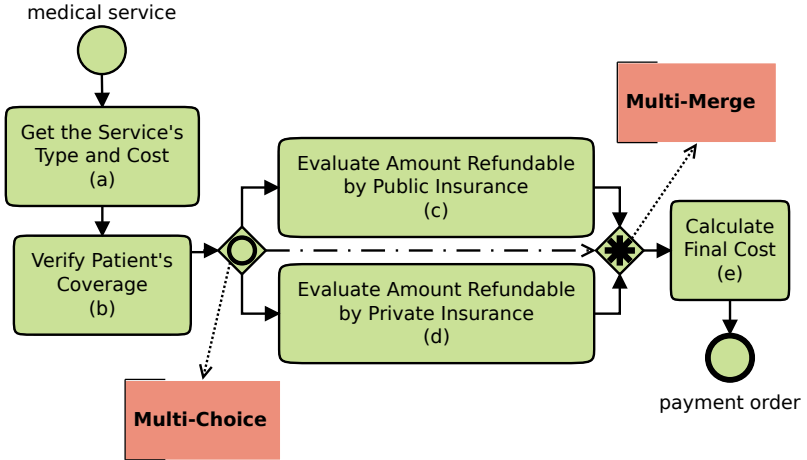

Complexity of the Multi-Choice / Multi-Merge Structure

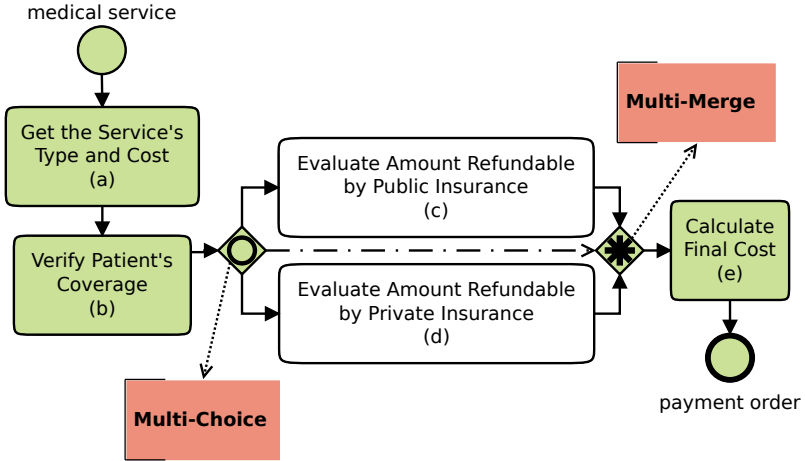

Complexity of the Multi-Choice / Multi-Merge Structure

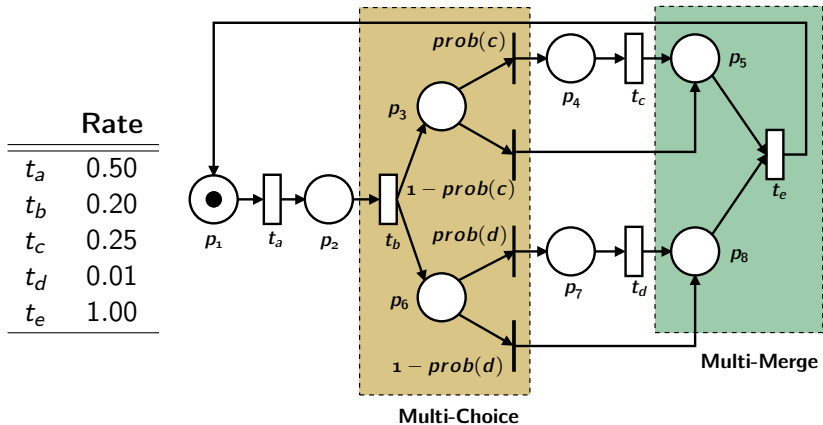

Complexity of the Multi-Choice / Multi-Merge Structure

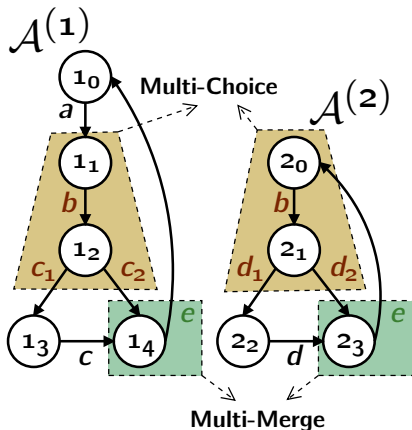

Complexity of the Multi-Choice / Multi-Merge Structure

GSPN Model

SAN Model

Event	Rate
a	0.50
b	0.20
c_1	$prob(c) * 50$
c_2	$(1 - prob(c)) * 50$
c	0.25
d_1	$prob(d) * 50$
d_2	$(1 - prob(d)) * 50$
d	0.01
e	1.00

PEPA Model

```

// Execution rates and probabilities associated with the activities
r_a = 0.50;      r_b = 0.20;      r_c = 0.25;
r_d = 0.01;     r_e = 1.00;     r_immediate = 50.00;
prob_c = 0.85;   prob_d = 0.73;

// Medical service cost calculation components
PCalc = (a,r_a). (b,r_b) . (e,r_e) .PCalc;

// Public insurance refund
P1 = (b,T).((c1,prob_c * r_immediate) .(c,r_c). (e, T) .P1 +
         (c2,(1-prob_c) * r_immediate) . (e,T) .P1);

// Private insurance refund
P2 = (b,T).((d1,prob_d * r_immediate) .(d,r_d). (e,T) .P2 +
         (d2,(1-prob_d) * r_immediate) . (e,T) .P2);

PCalc <b,e> P1 <b,e> P2      // Whole system

```

Comparison Summary of the Formalisms

For the example of the Health-Care System

Modeling criteria	GSPN	PEPA	SAN
Expressive power	+	+	+
Abstraction power	+	+/-	+/-
Readability	-	+	+

Split/Merge Example

- Business Process Model

- Mapping to a Performance Analysis Model

Synthesis

- Concluding Remarks

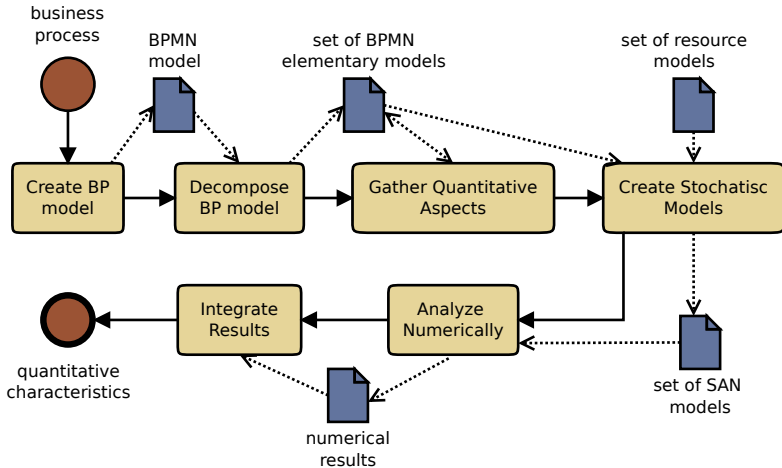

- Ongoing Work and Future Plans

Conclusion

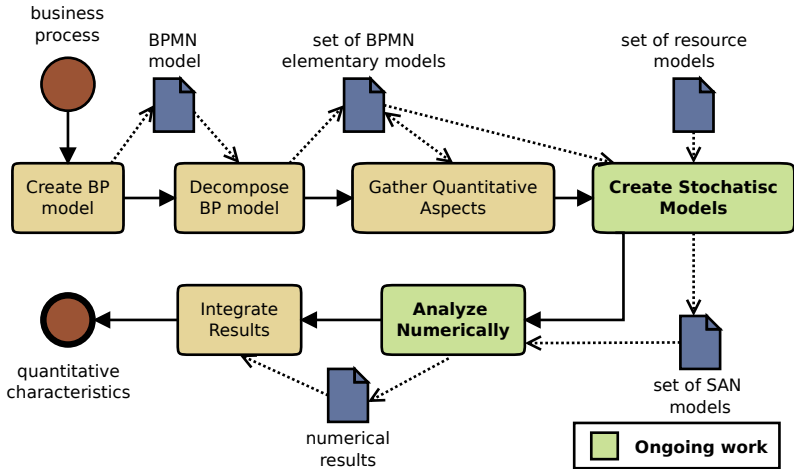

Modeling perspective

- ▶ The 3 modeling environments attend the basic scenarios
- ▶ **Immediate transitions** (GSPN) → advanced branching / merging without impacting readability nor analysis results
- ▶ **Functional transitions** (GSPN and SAN) → (i) functional dependencies between activities or (ii) rates that vary with the load of the system or the number of available resources
- ▶ **Compositionality** (PEPA and SAN) → (i) to build the model in a modular way or (ii) to enable a structured analysis
