Fundings:

Shell (ANP) Project

Sao Paulo Research Foundation (FAPESP).

Motivation 1 - the application perspective

- Weather forecasts :
3D compressible Euler equations on the sphere
- Important horizontal terms:
 - Linear hyperbolic operator
 - Nonlinear advection
- Desirable numerical properties:
 - Large timestep sizes
 - Accurate dispersion relations
- Today's state-of-the-art scheme (IFS-ECMWF):
 - semi-Lagrangian
 - semi-implicit linear operator (Crank-Nicolson)
 - spectral (spherical harmonics)

Goal1

How to improve wave dispersion damped by the Crank-Nicolson scheme preserving large time steps of the semi-Lagrangian semi-implicit?

Motivation 2 - Exponential integration with nonlinear advection

- Exponential integrators solve accurately **linear** problems
 - Usually allows very large timesteps

$$\frac{dU}{dt} = LU, \quad U(0) = U_0,$$

$$U(t_{n+1}) = e^{\Delta t L} U(t_n),$$

- For nonlinear equations
 - Usually nonlinearity limits timestep sizes

$$\frac{dU}{dt} = LU + N(U), \quad U(0) = U_0,$$

$$U(t_{n+1}) = e^{\Delta t L} U(t_n) + e^{\Delta t L} \int_{t_n}^{t_{n+1}} e^{-(s-t_n)L} N(U(s)) ds,$$

Goal2

How to treat N if dominated by nonlinear advection, in way to allow large time step sizes?

Semi-Lagrangian Exponential Integrator

Main Goal

Build a general semi-Lagrangian exponential class of schemes that allow:

- Precise solution of linear oscillations (hyperbolic)
- Accurate representation of nonlinear advection

considering very large time step sizes

Summary

- 1 Motivations
- 2 Exponential Integrators**
- 3 Semi-Lagrangian integration
- 4 Semi-Lagrangian exponential integration
- 5 Shallow water equations
- 6 Remarks

Non-linear exponential integration

Basic concept

$$\frac{dU}{dt} = \underbrace{LU}_{\text{Linear Discrete}} + \underbrace{N(U)}_{\text{Nonlinear Discrete}}, \quad U(0) = U_0$$

If L does not depend on time, then

$$U(t_{n+1}) = e^{\Delta t L} U(t_n) + e^{\Delta t L} \int_{t_n}^{t_{n+1}} e^{-(s-t_n)L} N(U(s)) ds,$$

“variation-of-constants” formula.

Keep in mind that $N(U)$ may include nonlinear advection $\vec{v} \cdot \nabla U$

Exponential-Time-Differencing (ETDRK)

Assume precise calculation of the matrix exponential

Moler and Van Loan, (2003) - Nineteen Dubious Ways to Compute the Exponential of a Matrix, Twenty-Five Years Later

EDT1RK

$$\begin{aligned}
 U(t_{n+1}) &= e^{\Delta t L} U(t_n) - \left(\int_{t_n}^{t_{n+1}} L^{-1} \frac{d(e^{-(s-t_{n+1})L})}{ds} ds \right) N(U(t_n)) + \mathcal{O}(\Delta t) \\
 &= e^{\Delta t L} U(t_n) + L^{-1} (e^{\Delta t L} - I) N(U(t_n)) + \mathcal{O}(\Delta t),
 \end{aligned}$$

Second Order Exponential-Time-Differencing

EDT2RK

$$U_1^{n+1} = \varphi_0(\Delta t L) U^n + \Delta t \varphi_1(\Delta t L) N(U^n),$$

$$U^{n+1} = U_1^{n+1} + \Delta t \varphi_2(\Delta t L) \left(N(U_1^{n+1}) - N(U^n) \right),$$

$$\varphi_k(z) = z^{-k} (e^z - t_{k-1}(z)), \quad t_k = \sum_{l=0}^k \frac{z^l}{l!}$$

Limited time step size due to CFL of nonlinear advection.

Cox, S. M., & Matthews, P. C. (2002)

Summary

- 1 Motivations
- 2 Exponential Integrators
- 3 Semi-Lagrangian integration**
- 4 Semi-Lagrangian exponential integration
- 5 Shallow water equations
- 6 Remarks

Oscillatory equations with nonlinear advection

$$\underbrace{\frac{\partial U}{\partial t} + \vec{v} \cdot \nabla U}_{\text{Advective nonlinear}} = \underbrace{LU}_{\text{Linear oscillatory}} + \underbrace{\tilde{N}(U)}_{\text{Nonlinear}}$$

$$\underbrace{\frac{DU(t, \vec{r}(t))}{Dt}}_{\text{Material derivative}} = L(U(t, \vec{r}(t))) + \tilde{N}(U(t, \vec{r}(t)))$$

$$\frac{d\vec{r}(t)}{dt} = \vec{v}(t, \vec{r}(t), U(t, \vec{r}(t))), \quad \vec{r}(0) = \vec{r}_0.$$

$\vec{r}(t)$ describes a particle trajectory along the flow.

Semi-Lagrangian semi-implicit

Used in IFS-ECMWF model (European Centre for Medium-Range Weather Forecasts)

Stable Extrapolation Two-Time-Level Scheme (SETTLS) of Hortal (2002)

$$\frac{U^{n+1} - U_*^n}{\Delta t} = \frac{1}{2} \left((LU)^{n+1} + (LU)_*^n \right) + \tilde{N}^{n+1/2},$$

where

- X^{n+1} is assumed to live in grid points.
- X_* denotes interpolation at departure points.
- Extrapolation:

$$\tilde{N}^{n+1/2} = \frac{1}{2} \left(\left[2\tilde{N}^n - \tilde{N}^{n-1} \right]_* + \tilde{N}^n \right),$$

- SETTLS also proposes an iterative scheme to solve the trajectory equation to calculate departure points from arrival grid points (2nd order accurate)

Summary

- 1 Motivations
- 2 Exponential Integrators
- 3 Semi-Lagrangian integration
- 4 Semi-Lagrangian exponential integration**
- 5 Shallow water equations
- 6 Remarks

General formulation

$$\underbrace{\frac{DU(t, \vec{r}(t))}{Dt}}_{\text{Material derivative}} = \underbrace{L(U(t, \vec{r}(t)))}_{\text{Linear oscillatory}} + \underbrace{\tilde{N}(U(t, \vec{r}(t)))}_{\text{Nonlinear}}$$

If L commutes in time*

$$U(t_{n+1}, \vec{r}(t_{n+1})) = e^{\Delta t L} U(t_n, \vec{r}(t_n)) + e^{\Delta t L} \int_{t_n}^{t_{n+1}} e^{-(s-t_n)L} \tilde{N}(U(s, \vec{r}(s))) ds + E_L.$$

where $\vec{r}(t)$ defines a particle trajectory.

This is the basis for Semi-Lagrangian exponential integrator methods.

*If this is not the case, approximate versions can be built (e.g. constant in within each time-step), so we have the error term E_L .

SL-EXP-SETTLS

The semi-Lagrangian exponential integrator:

$$U^{n+1} = e^{L\Delta t}(U)_*^n + e^{L\Delta t} \int_{t_n}^{t_{n+1}} e^{-(s-t_n)L} \tilde{N}(U(t, \vec{r}(t))) dt.$$

Stable Extrapolation Two-Time-Level Semi-Lag (Hortal et al 2002):

$$U^{n+1} = e^{L\Delta t} U_*^n + \frac{\Delta t}{2} e^{L\Delta t} \left[2\tilde{N}^n - e^{L\Delta t} \tilde{N}^{n-1} \right]_* + \frac{\Delta t}{2} \tilde{N}^n$$

* indicates calculation at departure points.

Can be simplified to use require only 2 exponentials per timestep.

SL-ETDRK

SL-ETD1RK

$$U_1^{n+1} = \varphi_0(\Delta tL) [U^n + \Delta t \varphi_1(-\Delta tL)N(U^n)]_*^n,$$

SL-ETD2RK

$$U_2^{n+1} = U_1^{n+1} + \Delta t \varphi_0(\Delta tL) \left[\psi_2(\Delta tL)N(U_1^{n+1}) - (\psi_2(\Delta tL)N(U^n))_*^n \right],$$

where

$$\psi_2(\Delta tL) = -\varphi_2(-\Delta tL) + \varphi_1(-\Delta tL).$$

Can be coded to use only 2 exponentials/ φ evaluations per timestep.

Remarks

Be careful when deriving such schemes!

- Lack of commutation: $e^{\Delta t L} U_*^n \neq (e^{\Delta t L} U^n)_*$
- Avoid application of operators on irregular grids (departure/midpoints)
 $(\varphi(\Delta t L) N(U^n))_*$
- Operators on advected quantities are ok: $e^{\Delta t L} U_*^n$
- Simple midpoint rule:

$$\int_{t_n}^{t_{n+1}} T(s) w(s) ds \approx \begin{cases} A_1 = \Delta t T(t_{n+1/2}) [w(t_{n+1/2})]_{\dagger} & \times \\ A_2 = \Delta t [T(t_{n+1/2}) w(t_{n+1/2})]_{\dagger} & \checkmark \end{cases},$$

† interpolation to traj. midpoints

- 6 Remarks

Shallow Water Equations

Rotation non-linear SWE (f is rotation/Coriolis parameter):

$$\begin{aligned}
 u_t + uu_x + vu_y &= fv - g\eta_x, \\
 v_t + uv_x + vv_y &= -fu - g\eta_y, \\
 \underbrace{\eta_t + u\eta_x + v\eta_y}_{\text{Nonlinear } D/Dt} &= \underbrace{-\bar{\eta}(u_x + v_y)}_{\text{Linear } \mathcal{L}} - \underbrace{\eta(u_x + v_y)}_{\text{Nonlinear } \tilde{\mathcal{N}}},
 \end{aligned}$$

- Well established 2D test case for atmospheric dynamical models.
- Linear waves can be solved very precisely with exponential of linear terms.
- Nonlinear advection can have long time steps with semi-Lagrangian
- Stability constraints related to nonlinear divergence ($\tilde{\mathcal{N}}$).

Exponential of \mathcal{L}

Fourier basis operator symbol:

$$\mathcal{L}U_{\vec{k}} = \begin{pmatrix} 0 & f & -gik_1 \\ -f & 0 & -gik_2 \\ -\bar{\eta}ik_1 & -\bar{\eta}ik_2 & 0 \end{pmatrix} \hat{U}_{\vec{k}},$$

Eigen-decomposition:

$$e^{\mathcal{L}(i\vec{k})} = Qe^{\Lambda}Q^{-1},$$

Eigenvalues (Λ):

$$\omega_f(\vec{k}) = 0, \quad \omega_g(\vec{k}) = \pm i\sqrt{f^2 + g\bar{\eta}\vec{k} \cdot \vec{k}},$$

φ functions:

$$\varphi_n(\Delta t \mathcal{L}(i\vec{k})) = Q\varphi_n(\Delta t \Lambda)Q^{-1},$$

* It is possible to do a *similar* exponential calculation on the sphere with Spherical Harmonics!

Methods

- RK-FDC: Energy conserving finite differences C-grid with Runge-Kutta
- SL-SI-SETTLS: Semi-Lagrangian, semi-implicit (Crank-Nicolson) spectral discretization.
- SL-EXP-SETTLS: Exponential version of SL-SI-SETTLS
- ETD2RK: Original ETD2RK scheme, with spectral in space.
- SL-ETD2RK: Semi-Lagrangian version of ETD2RK
- REF: Reference solution. 4th order Runge-Kutta fourth order in time, high resolution Eulerian spectral space.

Unstable jet on the plane

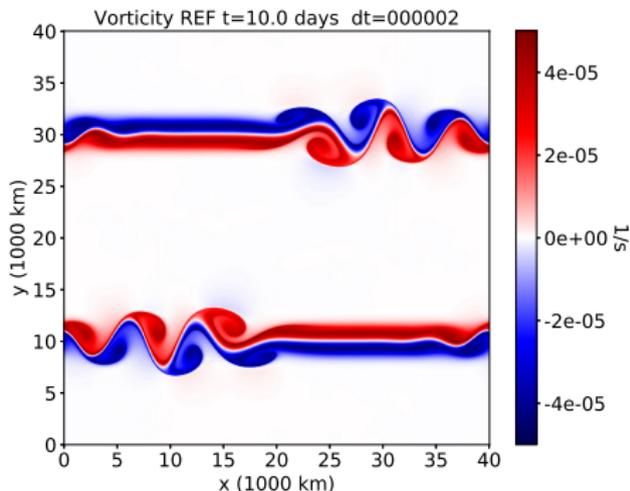

Initial conditions (stationary):

$$u(x, y) = u_0 (\sin(2\pi y/L_y))^{81}$$

$$v(x, y) = 0$$

$$\eta(x, y) = -\frac{f}{g} \int_0^y u(x, s) ds.$$

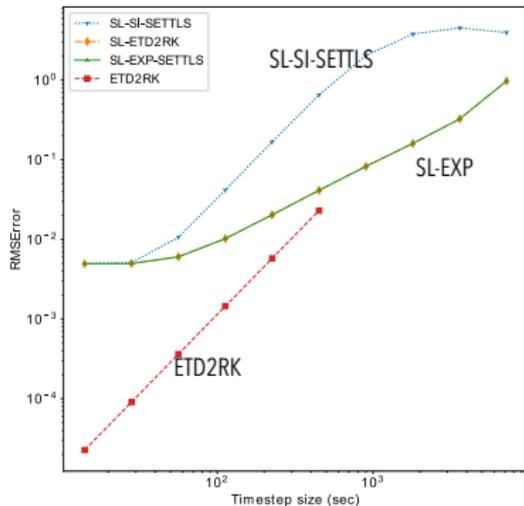

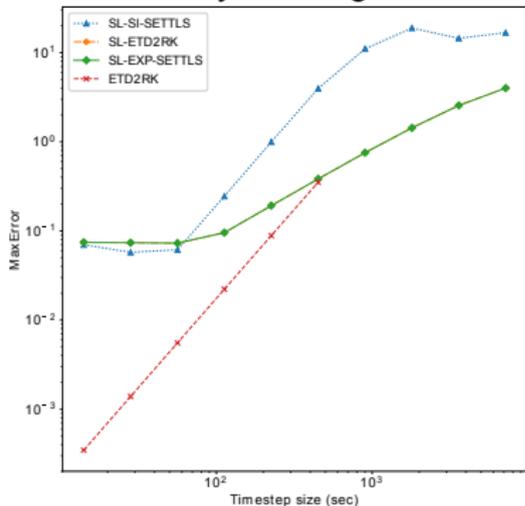

Small Gaussian perturbation to destabilize the flow.

Experiments with $\tilde{N} = 0$

$$\frac{dU}{dt} = LU$$

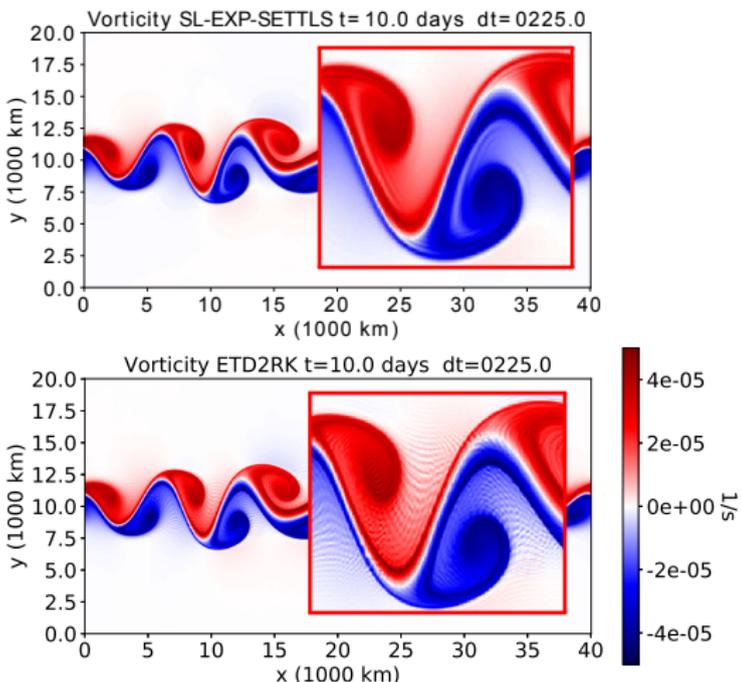

At 1 day of integration - dominance of linear waves

SL-ETD2RK is identical to SL-EXP-SETTLS, since no nonlinear divergence.

Experiments with $\tilde{N} = 0$

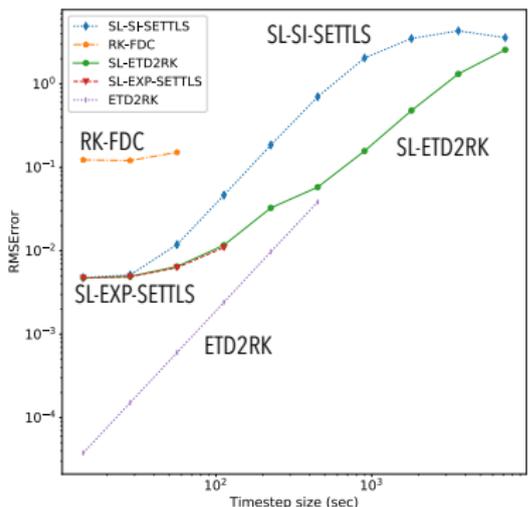

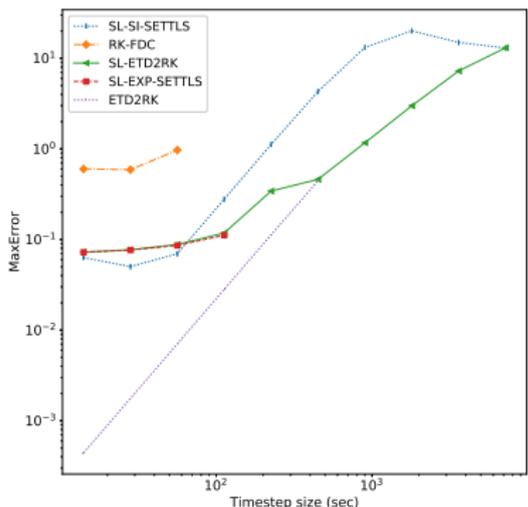

At day 10

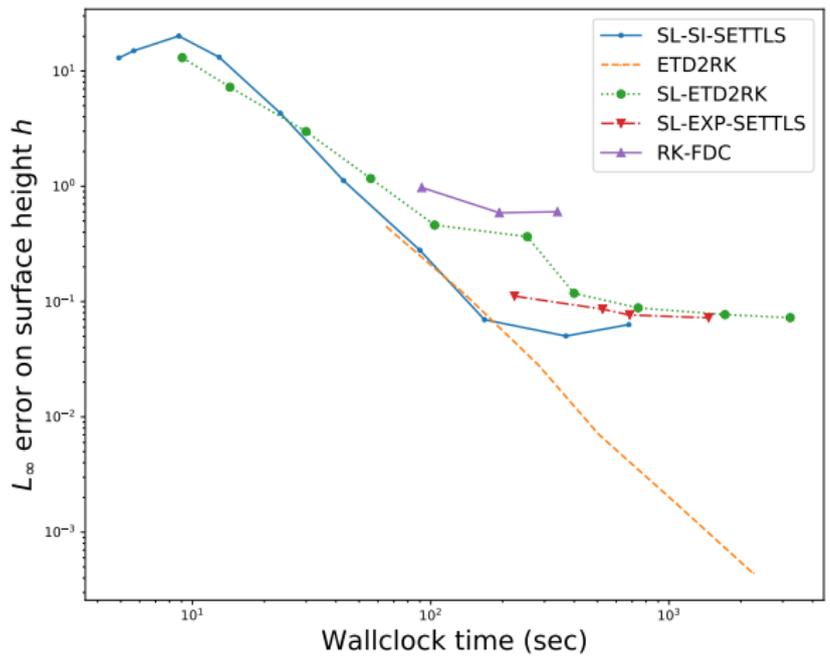

SL-SI-SETTLS/SL-EXP-SETTLS/SL-ETD2RK identically looking

Full SWE

At day 1 of integration (dominance of linear waves)

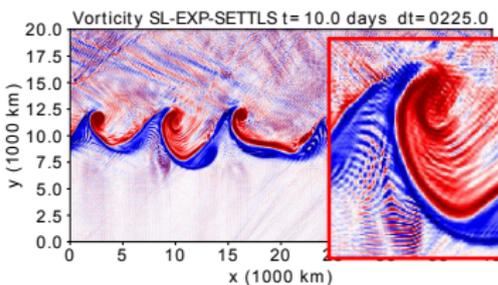

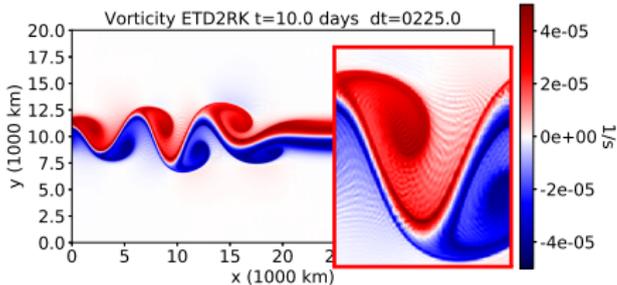

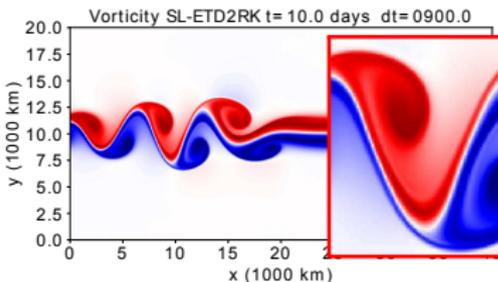

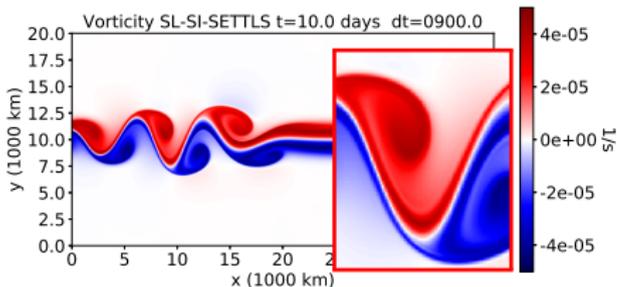

Computational cost

Errors vs. wallclock time at day 1.

Full SWE - Day 10

Vorticity field (implicit diffusion on the nonlinear divergence term with $\mu = 25.6 \times 10^6 \text{ m}^2\text{s}^{-1}$)

Summary

- 1 Motivations
- 2 Exponential Integrators
- 3 Semi-Lagrangian integration
- 4 Semi-Lagrangian exponential integration
- 5 Shallow water equations
- 6 Remarks**

Main conclusion

- Semi-Lagrangian coupling with Exponential Integration possible, but requires a lot of careful design
 - Better linear wave dispersion compared to Semi-Implicit
 - Stability for large time-steps compared to Classic Exponential Integration
 - Energy from non-linear wave interaction may need to be controlled (diffusion).
- Under construction
 - Connections with Lagrangian Laplace Transform Scheme
 - Spherical Shallow Water Model with Spherical Harmonics Exponential
 - Higher order semi-Lagrangian exponential (long term)

Preprint

Semi-Lagrangian Exponential Integration
under 2nd round of review in SIAM Sci. Comp.

General notation

Continuous initial value problem

$$\frac{du}{dt} = \mathcal{L}(u) + \mathcal{N}(u), \quad u(0) = u_0$$

Semi-Discrete (continuous in time)

$$\frac{dU}{dt} = LU + N(U), \quad U(0) = U_0,$$

Continuous with explicit nonlinear advection ($\vec{v}(u)$)

$$\frac{Du}{Dt} = \frac{\partial u}{\partial t} + \vec{v} \cdot \nabla u = \mathcal{L}(u) + \tilde{\mathcal{N}}(u), \quad u(0) = u_0,$$

Associated Semi-discrete

$$\frac{DU(t, \vec{r}(t))}{Dt} = L(U(t, \vec{r}(t))) + \tilde{N}(U(t, \vec{r}(t))), \quad U(t_0, \vec{r}(t_0)) = U^0,$$

$$\frac{d\vec{r}(t)}{dt} = \vec{v}(t, \vec{r}(t), u(t, \vec{r}(t))), \quad \vec{r}(0) = \vec{r}_0.$$
